RE: ABDUCTION BRACE FOR DEVELOPMENTAL DYSPLASIA OF THE HIP.

The above child is under the care of Mr. Colm Taylor and Ms. Sinead Boran.

He/She has a dysplastic hip – development of the ball and socket joint. A good source of information is the website www.hipdysplasia.org.

The abduction brace helps to maintain position and help the joint develop satisfactorily.

Please find enclosed information leaflets re: Dysplasia and information on the abduction brace.

The child will be in the brace:

for 23 hours a day until their next clinic appointment

bed time and naps only until their next clinic appointment
